Patent No. 5935811
GENERAL INFORMATION:
APPLICANT: Anderson, David J.
APPLICANT: Schoenherr, Christopher J.
TITLE OF INVENTION: Neuron-Restrictive Silencer Factor
TITLE OF INVENTION: Proteins
NUMBER OF SEQUENCES: 53
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                E: Flehr, Hohbach, Test, Albritton & Herbert
Four Embarcadero Center, Suite 3400
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: PATENTIN Release #1.0, Version #1.30
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/398,590A
FILING DATE: 03-MAR-1995
CLASSIFICATION: 435
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         REFERENCE/DOCKET NUMBER: A-60897/RFT/RMS

hematopoietic differentiation and a major determinant in lymphocyte differentiation. Other isoforms of Ikaros (see R92016-19) arise from differential splicing of Ikaros gene transcripts. Transgenic animals, esp. mice, having a mutated Ikaros transgene, esp. a mutation that alters the DNA binding domain of the Ikaros protein, are used as models to determine the effects of treatments for immune or nervous system disorders.

T-cell pathway regulatory gene, Ikaros - encodes family of unique zinc finger proteins, useful for treating immune system disorders Claim 14; Page 41-43; 112pp; English.
The Ikaros gene encodes a zinc finger protein which can be used in a therapeutic composition to treat animals with an immune system disorder. It may also be used for assessing whether a subject is at thisk for an immune disorder. It is of particular use in treating a disorder of the corpus striatum.

```
splicing of Ikaros gene transcripts. They are expressed primarily in T cells in the adult and may play a role as a genetic switch regulating entry into the T cell lineage. The invention provides Ikaros nucleic acids (see V42805-11 and V42840), polypeptides (see W7065-17), vectors and host cells. These can be used to treat T and B cell diseases (e.g. immune deficiencies caused by drugs, radiation or cancer), to control expression of heterologous genes placed under control of an Ikaros-responsive element, to treat nervous system diseases (e.g. Alzheimer's disease) and to modulate cell division, amplification or differentiation, especially in haematopoletic cells. Some Ikaros isoforms are antagonistic of others and may be used to inhibit interaction with DNA sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ä.

To control cell differentiation

Disclosure: Page 59-60: 158pp; English.

This is an example of a potential Tkaros sequence derived from a degenerate library of polypeptides based on the amino acid sequences of human and murine Ikaros isoform i proteins hik-1 (see W70964) and mik-1 (see W70966). A combinatorial library is produced using a degenerate library of genes which each include the fast a portion of potential Ikaros sequences. It can be generated by combinatorial library is generated by combinatorial mit the early stages of lymphocyte differentiation. Different isoforms arise from differential

                                                                                                   system or corpus striatum

Striatum 127-130; 111pp; English.

The present invention describes a purifiled peptide having at least one coffus invention describes a purifiled peptide having at least one of the following properties: (a) it stimulates transcription of a DNA sequence under the control of a delta A element, an NFKB element or an itaros binding oligonucleotide consensus sequence; (b) it binds to any of a delta A element, an NFKB element or an itaros binding oligonucleotide consensus sequence; (c) it competitively inhibits the binding of a naturally occurring itaros isoform to any of a delta A element, an NFKB element or an itaros binding oligonucleotide consensus sequence; (d) it competitively inhibits its faros binding to itaros responsive elements; or (e) it inhibits protein protein interactions of transcriptional complexes formed with naturally occurring itaros isoforms. The proteins, provided that they stimulate gene transcription under the control of delta A elements, NFKB elements and/or itaros-binding oligonucleotides, bind to delta A elements, NFKB elements and/or itaros-binding oligonucleotides, competitively inhibit inatos binding to itaros-responsive elements and/or itaros inhibit protein-protein interactions of transcriptions competitively inhibit interactions of transcriptions competitively inhibit interactions of transcriptions competitively inhibit interactions of transcriptions competitively inhibit interactions of transcriptions competitively inhibit interactions of transcriptions competitively inhibit interactions of transcriptions competitively inhibit interactions of transcriptions competitively inhibit interactions of transcriptions competitively inhibit interactions of transcriptions competitively inhibit interactions of transcriptions competitively inhibit interactions of transcriptions competitively inhibit interactions of transcriptions competitively inhibit interactions of transcriptions competitively inhibit interactions of transcriptions competities, competities competities
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  11;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  naturally occurring Ikaros isoforms, can be used to treat immune system disorders, e.g. leukaemia or AlDS, or corpus striatum disorders, e.g. Alzheimer's disease. The present sequence represents an Ikaros protein general formula from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             KPFKCHLCNYACQRRDALTGHLRTHSVEKPYKCEFCGRSYKQRSSLEEHKERCRAFLQNP 230

specification. Ikaros protein (19201) is provided in the specification. Ikaros protein is a master regulator of hematopoietic differentiation and a major determinant in lymphocyte differentiation. Isoforms of Ikaros (see 192014-19) arise from differential splicing of Ikaros gene transcripts. Transgenic animals, pref. mice, having a mutated Ikaros transgene, esp. a mutation that models to determine the effects of treatments for immune or nervous system disorders.
                                                                                                                                                              393
                                                                                                                                                                                                                                                                                                                                                                                                                                                     14-JAN-1999 (first entry)
Ikaros protein general formula.
CD3-delta gene; Ikaros gene; T cell; progenitor stem cell; leukaemia; differentiation marker; immune system; corpus striatum; AIDS;
Alzheimer's disease.

                                                                                                                                                                                                                                                                                                                                   T-cell pathway regulatory gene, Ikaros - encodes family of unique zinc finger proteins, useful for treating immune system disorders claim 14: Page 44-46; 112pp; English.

The Ikaros gene encodes a zinc finger protein which can be used in a therapeutic composition to treat animals with an immune system disorder. It may also be used for assessing whether a subject is at risk for an immune disorder. It is of particular use in treating a Sequence 537 AA;

Transgenic rodent for immune and nervous system disorders of selects of treatment for immune and nervous system disorders.

Disclosure; Fig 2, 102pp; Bnglish.

Chan almost full-length CDNA sequence (716060) codes for part (R92015) of the human Ikaros protein, a zinc finger protein that is a master regulator of haematopoietic differentiation and amjor cherminant in lymphocyte specification and development. Different isoforms (see R92014 and R92016-19) of mouse Ikaros been isolated. Transgenc animals, pref. mice, having a mutated Ikaros transgenc, esp. a mutation that alters the DNA binding domain of the Ikaros protein, are used as models to determine the effects of treatments for immune or nervous system disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                      111 RPTSGKMNCDVCGLSCISFNVLMVHKRSHTGERPFQCNQCGASFTQKGNLLRHIKLHTGE 170

The present invention describes a purified peptide having at least one system or corpus striatum

Striam or corpus striatum

Claim 1: Column 55-58; 111pp; English.

The present invention describes a purified peptide having at least one of the following properties: (a) it stimulates transcription of a DNA sequence under the control of a delta A element, an NFKB element or an Ixaros binding oligonucleotide consensus sequence; (b) it binds to any of a delta A element, an NFKB element or an Ixaros binding oligonucleotide consensus sequence; (c) it competitively inhibits the binding of a naturally occurring Ixaros binding to Ixaros responsive element; an NFKB element or an Ixaros binding oligonucleotide consensus sequence; (d) it competitively inhibits Ixaros binding to Ixaros responsive elements; or (e) it inhibits protein protein interactions of transcriptional complexes formed with naturally occurring ixaros isoforms. The proteins, provided that they stimulate gene transcription under the control of delta A elements, NFKB elements and/or Ixaros binding oligonucleotides, competitively inhibit binding of naturally occurring to Ixaros responsive elements and/or competitively inhibit Ixaros binding to Ixaros-responsive elements and/or inhibit protein-protein interactions of transcriptions of transcriptions of transcriptions of transcriptions of transcriptions of transcriptions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 12;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 naturally occurring Ikaros isoforms, can be used to treat immune system disorders, e.g. leukaemia or AIDS, or corpus striatum disorders, e.g. Alzheimer's disease. The present sequence represents a specifically claimed human Ikaros protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    341

This is the amino acid sequence of human Ixaros protein isoform

"Ik1, deduced from a cDNA clone (see V42806) obtained from a
Jurkat T cell line cDNA library. Native Ixaros is active in the
early stages of lymphocyte differentiation, binding to and
activating the CD3-delta gene enhancer (see V42804)

"Cof the human Ixaros family (see also W7096) and W70971) are
isoforms that arise from differential splicing of Ixaros gene
transcripts, and contain differential splicing of zinc fingers.

"They are expressed primarily in T cells in the adult and may play a
role as a genetic switch regulating entry into the T cell lineage.

The human and murine sequences (see also W70963 and W70965-68) are
very similar. The invention provides Ixaros nucleic acids, vectors
and host cells expressing Ixaros polypeptides. These can be used
to treat T and B cell diseases (e.g. immune deficiencies caused by
curys, radiation or cancer), to control expression of heterologous
genes placed under control of an Ixaros-responsive element, to
treat nervous system diseases (e.g. Alzheimer's disease) and to
the human cell of division, amplification or differentiation, especially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     : |:: | |: | |::| | |::| | |::| | |::| | |::| | |::| | |::| | |::| | |::| | |::| | |::| | |::| | |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::| |::|

T-cell pathway regulatory gene, Ikaros - encodes family of unique T-cell pathway regulatory gene, Ikaros - encodes family of unique Ciaim [14]. Figure 4: 112pp; English.

The Ikaros gene encodes a zinc finger protein which can be used in therapeutic composition to treat animals with an immune system disorder. It may also be used for assessing whether a subject is risk for an immune disorder. It is of particular use in treating disorder of the corpus striatum.

This is the amino acid sequence of murine Ikaros protein isoform mix-1, deduced from a cDNA clone (see V42808) obtained from a contact of the first is the amino acid sequence of murine Ikaros is active mature murine T cell line El4 library. Native Ikaros is active in the early stages of lymphocyte differentiation, binding to and activating the CD3-delta gene enhancer (see V42804). Proteins of the murine Ikaros family (see also W70953 and W7095-68) are isoforms that arise from differential splicing of Ikaros gene transcripts, and contain different combinations of zinc fingers. They are expressed primarily in T cells in the adult and may play a cole as a genetic switch regulating entry into the T cell lineage. The murine and human sequences (see W70964, W70965 and W7091) are very similar. The invention provides Ikaros nucleic acids, vectors and host cells expressing Ikaros polypeptides. These can be used to treat T and B cell diseases (e.g. immune deficiencies caused by drugs, radiation or cancer), to control expression of heterologous genes placed under conter), to control expression of heterologous
                           treat nervous system diseases (e.g. Alzheimer's disease) and to modulate cell division, amplification or differentiation, especially in haematopoietic cells. Some Ikaros isoforms are antagonistic of others and may be used to inhibit interaction with DNA sequences. Sequence 518 AA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New nucleic acid encoding Ikaros protein involved in early differentiation of lymphocytes - existing in several isoforms, and related products, used to treat e.g. immune diseases or cancer and to control cell differentiation

The sequence of 57.5 kDa mouse Ikaros protein mIK-1 (R92017) was deduced from mouse Ikaros protein miK-1 (R92017) was reclused from mouse Ikaros protein is a master regulator of hematopoietic differentiation and a major determinant in lymphocyte differentiation. Other isoforms of ikaros (see R92014, R92016 and R92018-19) arise from differential splicing of Ikaros gene transcripts. Transgenc animals, esp. mice, having a mutated Ikaros transgenc, esp. a mutation that alters the DNA binding domain of the Ikaros protein, are used as models to determine the effects of Sequence 518 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                        CGLSCISFNVLMVHKRSHTGERPFQCNQCGASFTQKGNLLRHIKLHTGEKPFKCHLCNYA 181

This is the amino acid sequence of human Ikaros protein isoform

Int.1, deduced from a CDNA clone (see V42840) obtained from a

Uurkat T cell line CDNA library. Native Ikaros is active in the
early stages of lymphocyte differentiation, binding to and
activating the CD3-delta gene enhancer (see V42804). Proteins

of the human Ikaros famniy (see also W70054 and W70059) are
isoforms that arise from differential splicing of Ikaros gene
transcripts, and contain different combinations of zinc fingers.

They are expressed primarily in T cells in the adult and may play a

role as a genetic switch regulating entry into the T cell lineage.

They are expressed primarily in T cells in the adult and may play a

role as a genetic switch regulating entry into the T cell lineage.

The human and murine sequences (see also W70965 and W70965-68) are

very similar. The invention provides Ikaros nucleic acids, vectors
and host cells expressing Ikaros polypeptides. These can be used
to treat T and B cell diseases (e.g. immune deficiencies caused by

drugs, radiation or cancer), to control expression of heterologous
genes placed under control of an Ikaros-responsive element, to

treat nervous system diseases (e.g. Alzheimer's disease) and to

modulate cell division, amplification or differentiation, especially
in haematopoietic cells. Some Ikaros isoforms are antagonistic of
others and may be used to inhibit interaction with DNA sequences.

Those—"Vector: pT713D-Pac (Pharmacia) with a modified polylinker; Site_1: Not I: Site_2: Eco RI: 1st strand cDNA was primed with a Not I - oligo(dT) primer [5] read of property and the strand cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT713 vector. RNA provided by Dr. Bertrand Jordan. Library went through two rounds of normalization, and was constructed by Bento Soares and M.Falma Bonaldo."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                ñ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AIO40940 217 bp mRNA EST 27-AUG-1998 ov53b04.x1 Soares_testis_NHT Homo sapiens cDNA clone IMAGE:1641007 3's similar to TR:008900 008900 AIOLOS;, mRNA sequence.

3/]; double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified p1713 vector. RNA provided by Dr. Bertrand Jordan. Library went through two rounds of normalization, and was constructed by Bento Soares and M.Fatima Bonaldo."
